Experience

GE Appliances **Jan 2026 - Present**
Software Engineer (Automation) *Louisville, KY*

- Cut regression testing time from 2 days to 4 minutes by architecting a **TypeScript**/**Playwright** end-to-end and API automation framework from scratch (5,292+ test cases) with a **GitHub Actions** CI/CD pipeline; adopted as the standard template across 3 engineering teams, and selected to lead API testing for Procerious, GE's company-wide E2E framework.
- Cut API response time by 60% by diagnosing a sequential PII decryption bottleneck on a core Admin API endpoint and recommending multithreaded processing, and cut query time 40-60% by rewriting a production **AWS Timestream** query to filter before fetching.
- Resolved timeout failures on requests with 80+ sequential operations by validating an async **AWS** redesign (SNS, Lambda, DynamoDB), confirming correctness across create and update API endpoints.
- Cut test authoring time from 90-100 minutes to under 2 minutes per feature by independently migrating to **OpenAI Codex** with **MCP** and letting it observe live Playwright browser sessions, after GitHub Copilot's MCP access was blocked.

Syracuse University **Jun 2025 - Dec 2025**
Software Engineer *Syracuse, NY*

- Improved export speed by 35% by optimizing nested loops and switching to faster JSON serialization in **Flask** developer-productivity APIs used by 10+ lab users.
- Fixed 5 production issues in a **RAG** pipeline, including a token-limit overflow that truncated context and caused hallucinated responses, and a retry-logic bug that dropped requests on API timeouts.

JMA Wireless **Mar 2025 - May 2025**
Software Development Engineer *Syracuse, NY*

- Cut projected AWS costs by 71% by architecting a **Python** serverless ingestion pipeline on AWS Lambda and S3 that processed 25K+ fan-feedback logs per month for 1M+ users.
- Cut P95 cold-start latency by 50% with structured logging and correlation IDs in **CloudWatch** Insights, and reduced insight-extraction time by 90% by migrating NLP classification from Lambda to auto-scaling **Docker** containers on EC2.

WaytoWeb Pvt. Ltd. **Dec 2022 - May 2023**
Software Engineer Intern *India*

- Powered 5 internal dashboards for 30+ daily users with RESTful APIs built on **Django** and **MySQL**, and cut peak API latency by 500ms+ through ORM query optimization and indexing.

Projects

Mon Tracker | *Personal Finance Tracker* | *Next.js, TypeScript, PostgreSQL*

- Built and deployed a full-stack finance app on Vercel (~12K lines of **TypeScript**/TSX, 149 unit tests), owning every layer from the **PostgreSQL** data model to the budgeting UI.
- Integrated the **Plaid** API for cursor-based incremental bank transaction sync, secured with Google OAuth.

Researchr-Space | *Medical Research Platform* | *React, Node.js, Supabase*

- Compressed the initial release cycle from 3 months to 5 weeks on a full-stack **React** platform adopted by four medical school research teams, cutting data parsing failures by 90% with rate-limited Edge Functions and secure API proxying.

Education

Syracuse University **May 2025**
Master of Science in Computer Science *Syracuse, NY*

Technical Skills

Languages & Web: Python, TypeScript/JavaScript, Java, C++, REST APIs, React.js, Next.js, Node.js, Flask, Django, FastAPI
Cloud & DevOps: AWS (Lambda, EC2, S3, SNS, DynamoDB, API Gateway, CloudWatch, Timestream), Docker, CI/CD (GitHub Actions)
Databases: PostgreSQL, MySQL, MongoDB, DynamoDB, Prisma (relational and non-relational)
AI Tooling: Claude Code, Anthropic SDK, OpenAI Codex, MCP, GitHub Copilot
Practices: Git, Agile/Scrum, TDD, automated testing (unit, integration, E2E), root-cause analysis
